Turkey α-1-Acid Glycoprotein

Catalog No. 8355

Analysis SDS PAGE: ~44 kDa band, ≥98%

Concentration 1.5 mg/ml (Assuming an $E_{280}$ of 10,095 cm$^{-1}$M$^{-1}$ and a molecular weight of 44,000 Da)

Buffer 150 mM NaCl, 10 mM sodium phosphate, 0.05% NaN$_3$ (pH 7.4)

Storage -20°C

Source Normal turkey serum

α-1-Acid glycoprotein (A1AGP) is one of the most acidic proteins found in serum. It has a molecular weight of approximately 44 kDa with a high (~45%) content of carbohydrate. The molecular weight of the non-glycosylated polypeptide is 22.3 kDa. It is a positive acute phase reactant in chickens, where A1AGP levels increase in response to inflammation, tissue injury and disease. The acute phase response of A1AGP in turkeys remains to be investigated. A1AGP is purified using a combination of acid extraction, precipitation, gel filtration and ion-exchange chromatography steps.
